

Same cuts and better final fabric quality - focus on P-clearing

Field Study 100-L_2024
PRISMA compared to former competitor model, Ne 30

Field study results prove the majority of **YarnMaster® PRISMA** with its unique polypropylene clearing under all circumstances.

The study took place in **India** at a Loepfe customer plant to compare **YarnMaster® PRISMA** to the **former competitor model** on final fabric quality with a focus on P clearing.

PRISMA is the right choice for profitable yarn clearing in the application of **100% cotton Ne 30** produced for the highest requirements.

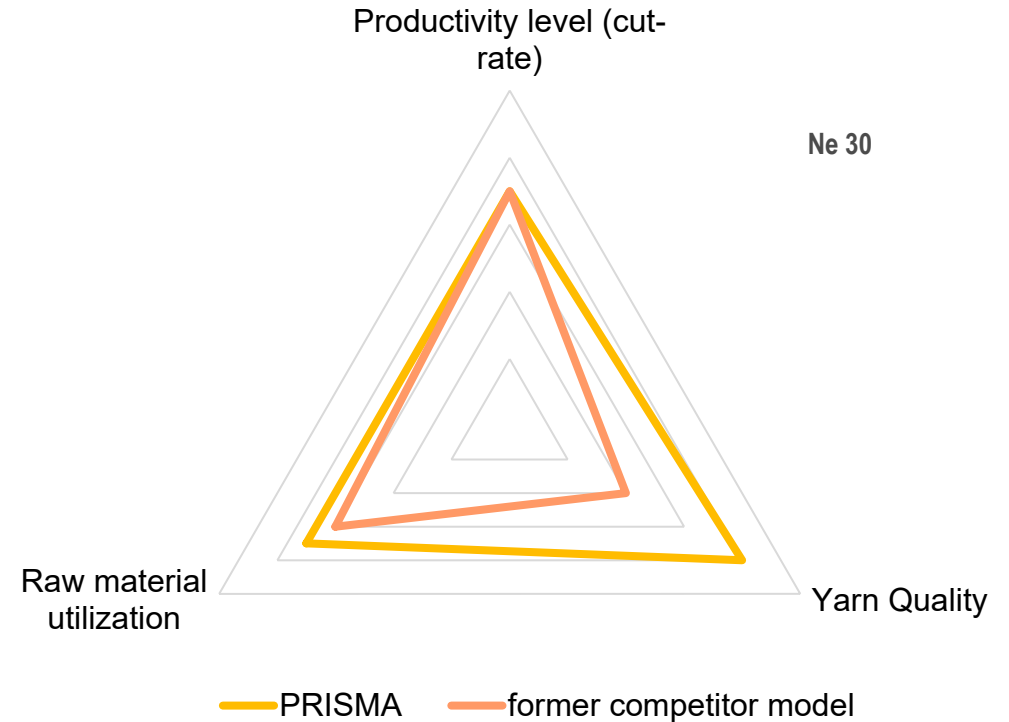

Same cuts and better final fabric quality - focus on P-clearing

1. Overall summary	3
2. Study set-up	4
3. Results on yarn clearers	5
4. Results on final fabric	7

1. Overall summary

- PRISMA achieves a precision rate of **65%** in P-clearing, outpacing the former competitor model's rate of 29%
- PRISMA has more than **double** the number of **justified P-cuts** ensuring a better final fabric quality

2. Study set-up

Sensors:

- PRISMA DMFP* compared to former competitor model focus on P clearing

Location:

- Loepfe customer India

Raw Material:

- 100% cotton from India Ne 30 combed compact (Shankar6)

Winder:

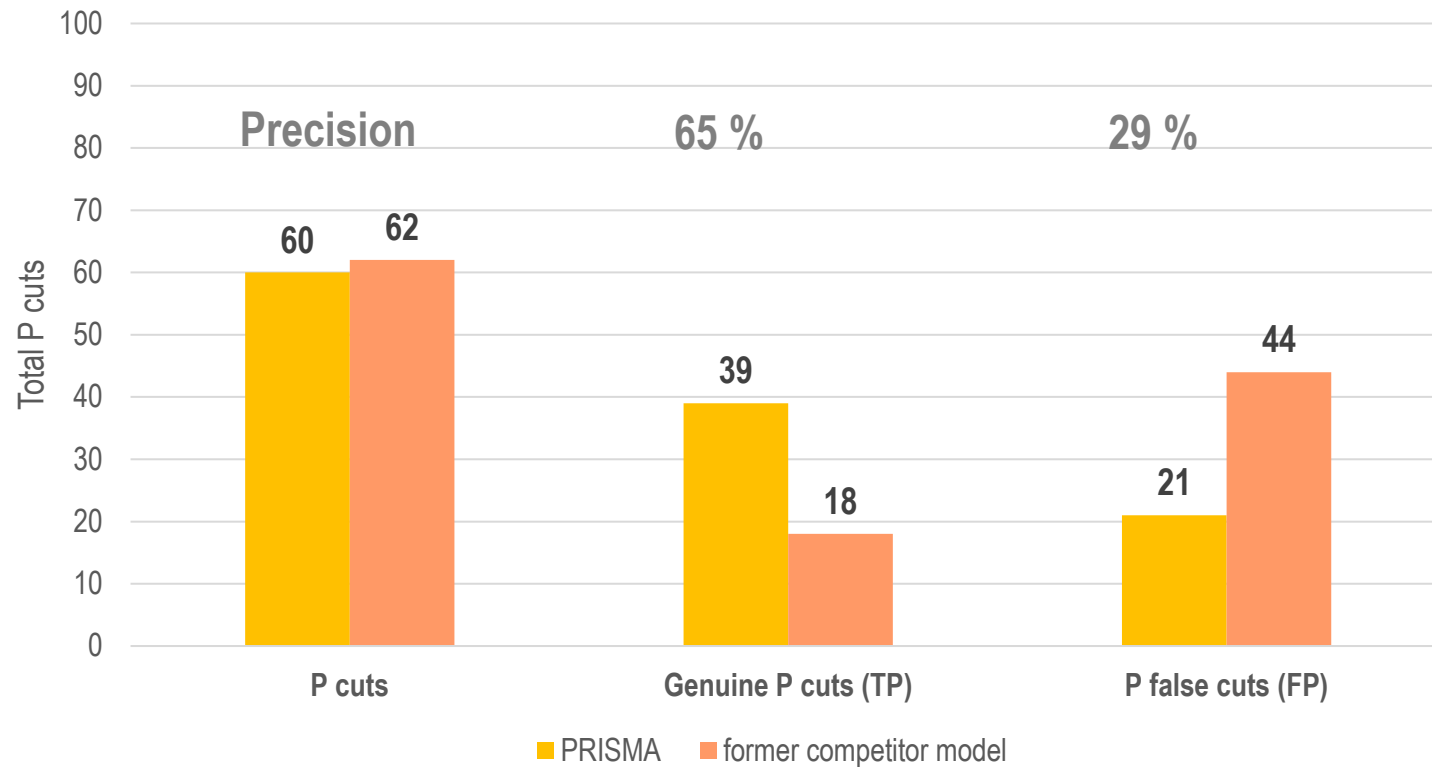

- Study was done on different winding machine types fed with same ring frame bobbins

Goal:

- Same cuts and better final fabric quality - focus on P clearing

3. Results on yarn clearers

- PRISMA achieves a precision rate of 65% in P-clearing, outpacing the former competitor model's rate of 29%
- Total winding length in km: 582 (total 20 kg of knitted fabric) with climate compensation of 35%

$$\text{Precision} = \frac{TP \text{ (true positive)}}{FP \text{ (false positive)} + TP \text{ (true positive)}} * 100 \%$$

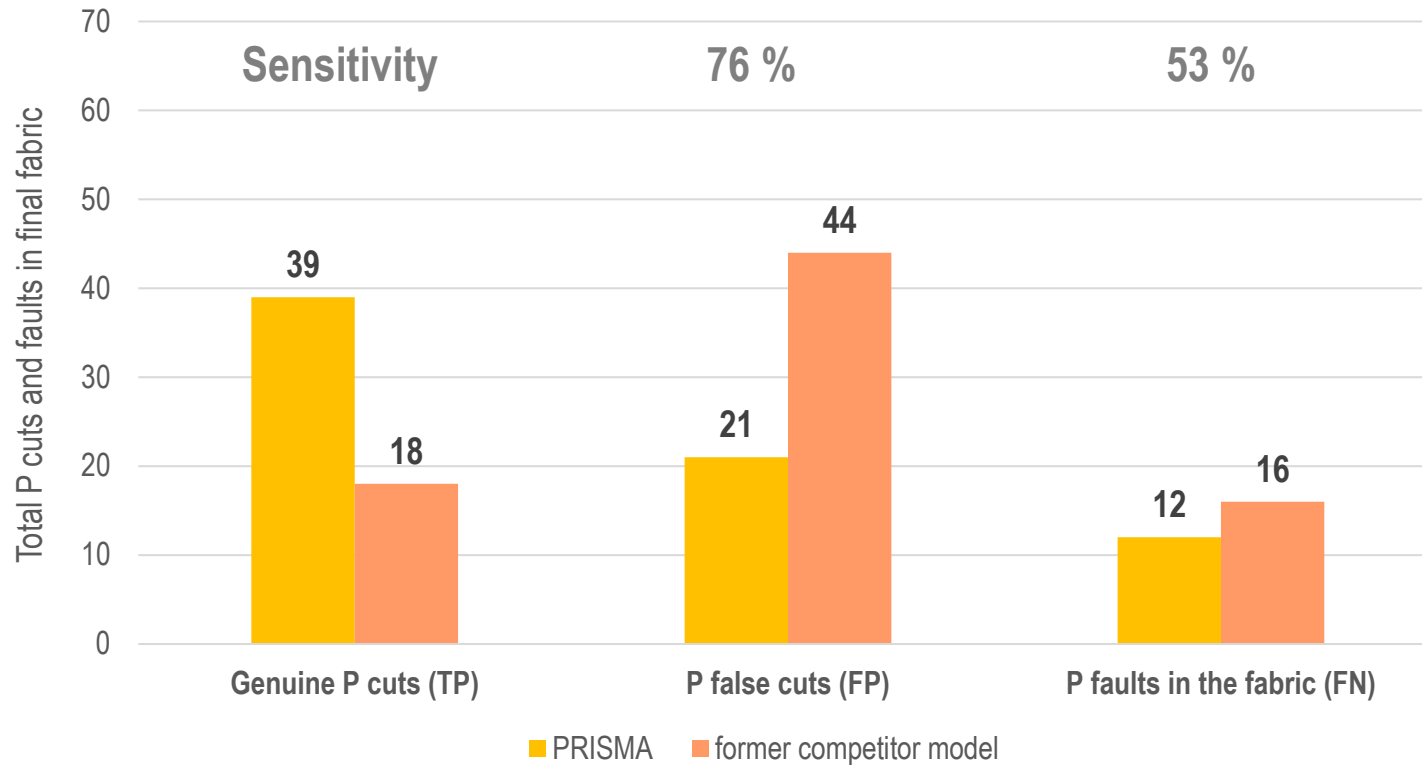

3. Results on yarn clearers

- PRISMA has more than double genuine P cuts
- Most of the detected P events of PRISMA are the disturbing small ones
- Total winding length in km: 582 (total 20 kg of knitted fabric)

4. Results on final fabric

- PRISMA reaches more than a 100 % higher total detection of P events
- P faults per kg dyed fabric: Prisma 0.6 and former competitor model 0.8

$$\text{Sensitivity} = \frac{TP \text{ (true positive)}}{TP \text{ (true positive)} + FN \text{ (false negative)}} * 100 \%$$
